Deepfake

Directions
Read the following scenario and use the information provided to answer the questions below.

Anjali and Peter like making AI videos of their dogs doing funny things like dancing or wearing silly costumes. One day they decided to see if they could add themselves to a video and saw it was pretty easy to do. They laughed so loud Anjali's mom came in to see what was so funny. She was amazed at how real the video looked. Anjali's sister took one look and said, "You guys are such amateurs."

Later that night, Anjali asked her sister what she meant by the comment. Her sister said, "when you get a little older, I will show you, but let's just say I could take your face and your voice and make a video of you saying and doing anything I want. I bet it could even fool you into believing you said it."

Anjali felt uncomfortable by the comment her sister made. She texted Peter and he said she was probably talking about deepfakes. Anjali looked it up and saw that even experts can have trouble spotting if something is real or if it is a deepfake.

1. *Are all videos made using deepfakes?*

As we learned in the video, Leonard was making deepfake videos, which is the same kind of video Anajali's sister is referencing here. As a reminder, a deepfake is when a person uses technology to create a picture, video or a voice recording of someone doing or saying something that looks real, but that situation never happened.

2. Think about the video that Anjali and Peter made and then think about the kinds of videos leonard was making, complete the T chart comparing the two.

Anjalli and Peter's Video	Leonard's Video
Anjali and Peter might make these videos because they wanted to have fun.	Leonard might make these videos because _____ _____
There were dogs in Angali and Peter's video so they did not need to get consent.	The people in Leonard's video didn't give consent. They might feel _____
A consequence for Anjali and Peter's video could be they could share it with their family and everyone laughs a lot.	A consequence if Leonard shared the video with others could be _____ _____

3. Think about the research Anjali found where even experts can have trouble spotting if something is real or fake. Do you think AI tools such as this should be available to anyone? Should there be any kindof requirments such as age limits, consent to use someone's image or voice or other conditions in place before a person can use the AI tool?
